ABSTRACT

In many colleges, students often face difficulties in reporting issues such as electricity failures, Wi-Fi problems, classroom maintenance, and infrastructure complaints. Due to the absence of a centralized platform, students frequently do not know where to direct their concerns, and as a result complaints are delayed, misplaced, or ignored altogether. This paper presents the design, architecture, and implementation approach of a Smart Complaint Management System for colleges, developed to simplify and automate the complaint reporting and resolution workflow. The primary objective of the system is to provide a single digital platform through which students can register complaints, monitor their resolution status, and receive timely updates. Complaints submitted through a web-based interface are automatically categorized and routed to the concerned department electrical, IT, academic, hostel, or general maintenance eliminating the ambiguity and delay associated with manual reporting.

1. INTRODUCTION

Educational institutions house a diverse and constantly changing population of students, faculty, and administrative staff, all of whom rely on shared infrastructure and services. Given the scale and complexity of a college campus, issues ranging from electrical faults and non-functional Wi-Fi access points to classroom maintenance and academic grievances arise on a near-daily basis. Traditionally, complaint handling in colleges is carried out manually through written applications, suggestion boxes, or verbal communication with the concerned authority. This conventional process is time-consuming, lacks accountability, and offers no reliable mechanism through which a student can track the progress of a submitted complaint. In many cases, complaints get lost in administrative channels or are not taken seriously due to the absence of proper documentation and follow-up, leaving students dissatisfied and unheard.

The Smart Complaint Management System (SCMS) proposed in this paper is designed to directly address these shortcomings by offering an efficient, reliable, and user-friendly digital

platform for registering, managing, and resolving complaints. The system acts as a structured bridge between students and college administration, ensuring that every complaint is logged systematically, assigned a unique tracking identifier, and addressed within a reasonable and measurable time frame.

A key design principle of the proposed system is role-based access control. Students, department staff, and administrators each interact with a tailored view of the platform suited to their responsibilities: students submit and track complaints; department staff view and resolve complaints routed to them; and administrators oversee the entire complaint pipeline, reassign complaints where necessary, and generate analytical reports. Automated notifications keep all stakeholders informed at every stage of the complaint lifecycle, from submission to acknowledgement to resolution.

2. LITERATURE REVIEW

A number of studies have explored complaint and grievance management systems across different domains, ranging from customer relationship management (CRM) in commercial organizations to grievance redressal in government and healthcare institutions. Table 1 summarizes the key contributions and limitations of related work that informed the design of the proposed system.

Table 1: Literature Survey

Sr. No.	Author(s) / Year	Title / System	Methodology Used	Key Findings	Limitations
1	Smith et al. (2019)	Complaint Management Systems in Organizations	CRM-based approach	Improved customer satisfaction and service quality	Not focused on educational institutions
2	Kumar & Sharma (2020)	Web-Based Complaint Management System	Web application using centralized database	Enables online complaint tracking and accessibility	Limited real-time notification features
3	Patel et al. (2021)	Online Grievance Redressal System	Cloud-based architecture	Faster complaint resolution and transparency	Lacks advanced analytics
4	Singh & Verma (2018)	Complaint Handling in Service Sector	Manual + semi-automated approach	Emphasizes importance of timely response	Manual processes cause delays
5	Healthcare Study (2017)	Patient Complaint Analysis System	Data analysis of complaints	Identifies service quality issues	Not suitable for college systems
6	Johnson et al. (2022)	Smart Complaint Management System	Automated categorization and tracking	Real-time tracking improves efficiency	High implementation cost
7	Lee & Park (2020)	Digital Complaint Platform	Web + mobile integrated system	User-friendly and accessible	Requires ongoing maintenance

The reviewed literature indicates a consistent trend: digitization of complaint handling improves accessibility, transparency, and resolution speed compared to manual processes. However, most existing systems are either designed for generic commercial or municipal use and are not tailored to the specific workflow of an academic institution, or they are limited in scope — lacking real-time notifications, automated department-wise routing, or analytical reporting. Furthermore, systems reviewed from Smith et al. (2019), Singh & Verma (2018), and the Healthcare Study (2017) confirm that manual or semi-automated processes consistently introduce delays and reduce accountability, reinforcing the need for a fully automated, college-specific solution such as the one proposed in this paper.

3. PROBLEM STATEMENT

Based on the review of existing literature and observation of current practices within college campuses, the following problems have been identified in traditional complaint handling mechanisms:

- Complaint handling in colleges is mostly manual or semi-manual, relying on paper forms or verbal reporting.
- Students face difficulty identifying the correct authority or department to which a complaint should be directed.
- Complaints may get lost, ignored, or delayed due to the absence of a proper tracking system.
- There is no centralized platform to manage, store, or retrieve historical complaint records.
- Students have no means of tracking the real-time status of a submitted complaint.
- There is a general lack of transparency and two-way communication between students and authorities.
- Administrative staff find it difficult to manage a large volume of complaints efficiently without a structured system.
- No fixed or enforced time frame exists for the resolution of complaints.
- The absence of real-time notifications means students are often unaware of updates to their complaints.

- There is no mechanism for data analysis to identify recurring or systemic issues on campus.

4. OBJECTIVE

The proposed system is designed with the following specific objectives:

- To develop a centralized system for managing all student complaints within a single platform.
- To provide an easy and intuitive user interface for complaint submission.
- To enable online complaint registration accessible anytime and from any location.
- To allow students to track the real-time status of their complaints.
- To ensure quick, efficient, and accountable resolution of complaints.
- To improve communication between students and college authorities.
- To provide transparency throughout the complaint handling process.
- To implement automated notifications for status updates and responses.
- To categorize complaints systematically for better organization and departmental routing.
- To maintain a secure and reliable database of all complaint records.
- To generate reports and analytics that support administrative decision-making.
- To reduce manual work, paperwork, and administrative overhead.
- To improve overall student satisfaction and the general campus environment.

5. METHODOLOGY

The AI-based Smart Financial Decision Support System's method involves gathering and analyzing data about your financial situation using three steps. The first step is to gather the relevant user data and organize it in a way that can be analyzed. The second step is to preprocess the data by eliminating errors, categorizing transactions, and readying the data for intelligent processing. After the data has been preprocessed, AI and machine learning will be applied to it to analyze the user's spending habits, find financial trends, and provide insights for the decision-making process.

In the third step, the system will perform budgeting, expense tracking, risk assessment, and financial forecasting based on user data. Additionally, personalized recommendations will be generated by the system's AI algorithms, with predictions on future expenses and identification of unusual spending behavior. Alerts will also be provided to users when the amount spent over the budget is reached and provide suggestions for improving their savings/investment plan. A user interface will also be developed that allows users to enter financial data, track reports, and receive AI-generated recommendations in real time. The methodology of collecting data, providing intelligent analysis, generating predictions, and automating guidance allows for the development of a financial decision support system that enhances the accuracy, efficiency, and smart financial management capabilities of the user

5. COLLECTIONS

A. Dashboard

The Smart Financial Decision Support System Using AI dashboard is the primary user interface and is designed to give users a comprehensive view of their financial condition in one location. Important financial data including overall income, total expenditure, available balance, savings, and the amount of budget used are shown in a simple, user-friendly manner. Users can use the dashboard to quickly track their daily financial transactions and make well-informed decisions.

Figure1: Dashboard

B. Analysis

Look at the proposed system dashboard's design, functionality, and performance in terms of usability, efficiency, and real-time data visualization. Pay attention to how well the dashboard shows important information like system metrics, user activity, and operational insights. Look at the design of the interface, the way it navigates, and how well it works on different devices. Also, check to see if the connection between backend data processing and frontend visualization is correct and fast.

Figure 2: Analysis of the Proposed System

6. RESULTS AND DISCUSSION

Artificial intelligence into the financial management process has the potential to greatly expand upon the more traditional means of financial decision-making. Users benefited from receiving personalized recommendations and automated alerts that allowed them to react immediately to overspending and budget related issues. The dashboard and analytic capabilities of the system helped users understand better financial trends and therefore have greater control over their financial resources. While the quality of the data provided by the users and the accuracy of the model greatly impact the performance of the system, the overall results indicate that the proposed system is both practical and effective. As a result, this project has successfully accomplished its goal of providing users with an intelligent, user-friendly financial decision support system that ultimately promotes and supports personal financial stability and long-term financial planning.

CONCLUSION

Smart Financial Decision Support System with AI goes beyond basic budgeting apps by acting as an intelligent financial assistant that continuously learns from user behavior and adapts recommendations accordingly. The core idea is to combine data analytics, machine learning, and automation to help individuals and small businesses make better financial decisions with minimal manual effort.

At the heart of this system is data collection and integration. It gathers financial data such as income, expenses, transaction history, savings patterns, and even external economic indicators. This data can be sourced from bank APIs, user inputs, or financial platforms. Once collected, the system uses preprocessing techniques to clean and organize the data, ensuring accuracy and consistency for further analysis. The machine learning component plays a crucial role in identifying patterns and predicting future outcomes.

For example, supervised learning models can classify spending behavior into categories like essential, non-essential, and luxury expenses. Time-series forecasting models can predict future expenses or savings trends, helping users anticipate financial situations. Additionally, anomaly detection algorithms can identify unusual spending patterns, alerting users to potential fraud or financial risks.

Another key feature is personalized financial recommendations. Based on user behavior and goals, the system suggests budgeting strategies, investment opportunities, and saving plans. For instance, if a user spends excessively on non-essential items, the system can recommend a revised budget plan. Similarly, it can suggest setting aside emergency funds or investing in suitable financial instruments based on risk tolerance
